Certificate of Participation

This certificate is presented to

Mohamed Ladjal

for participation with an

Oral Presentation

entitled

“ANFIS-Based Intelligent Modelling with PCA Features Selection for Optimal Coagulant Dosage in Drinking Water Quality Monitoring”

in the 2nd International Conference on Engineering, Natural Sciences, and Technological Developments (ICENSTED 2025)
that was held at Bayburt, Türkiye on June 20-23, 2025.

Assoc. Prof. Dr. Yunus Kaya

Bayburt University
ICENSTED 2025 Conference Chairman

ANFIS-Based Intelligent Modelling with PCA Features Selection for Optimal Coagulant Dosage in Drinking Water Quality Monitoring

Abstract

Coagulation is the most important step in drinking water treatment. Determining the optimal coagulant dosage is vital for the maintenance of acceptable treated water quality, as insufficient dosage will result in unqualified water quality. Moreover, coagulant dosing rate is non-linearly correlated to raw water indicators such as turbidity, conductivity, pH, temperature, etc. Optimal coagulant dosage modelling of surface water quality using artificial intelligence techniques is essential for the effective management process and environmental protection of water resources production and distribution systems. Therefore, in this study, an adaptive neuro-fuzzy inference system (ANFIS) model and principal component analysis (PCA) were developed to predict the optimal coagulant dosage in the Cheliff dam from Mostaganem (Algeria). The proposed model in this paper contains PCA in feature selection and the ANFIS method for predicting the optimal coagulant dosage values. Fifteen of them were collected in 4 seasons during the period 2017-2018 from Cheliff dam were used to develop PCA-ANFIS hybrid model. As a result, a relatively higher correlation was found between observed and the coagulant dosage applied values. The results indicated that the ANFIS model gave reasonable estimates for the output predicted value with a high degree accuracy and robustness. In conclusion, this paper suggests that PCA-ANFIS methodology produce very successful findings and has the ability to predict coagulant dosage in water resources. The outcomes of this research provide more information, simulation, and prediction about water quality status. PCA-ANFIS model can be used in further researches on water quality assessment. Its performance is more competitive when compared with artificial neural networks. Furthermore, the results demonstrated that the proposed procedure has a great potential in water quality monitoring.
